

Fixing Missing Test Visualization and Dashboard clutter

ThoughtCapture Summary · 7/30/2026

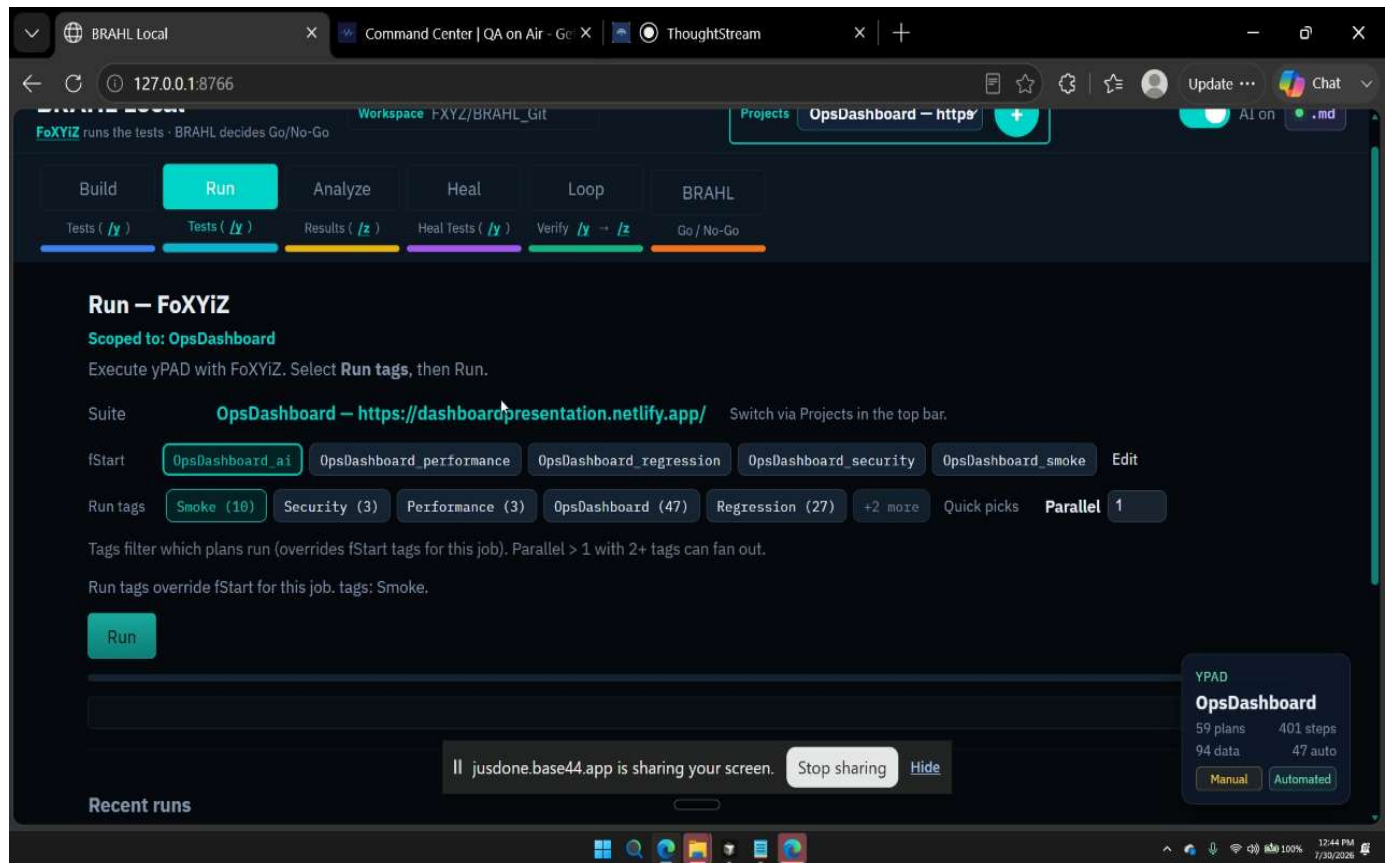

SUMMARY

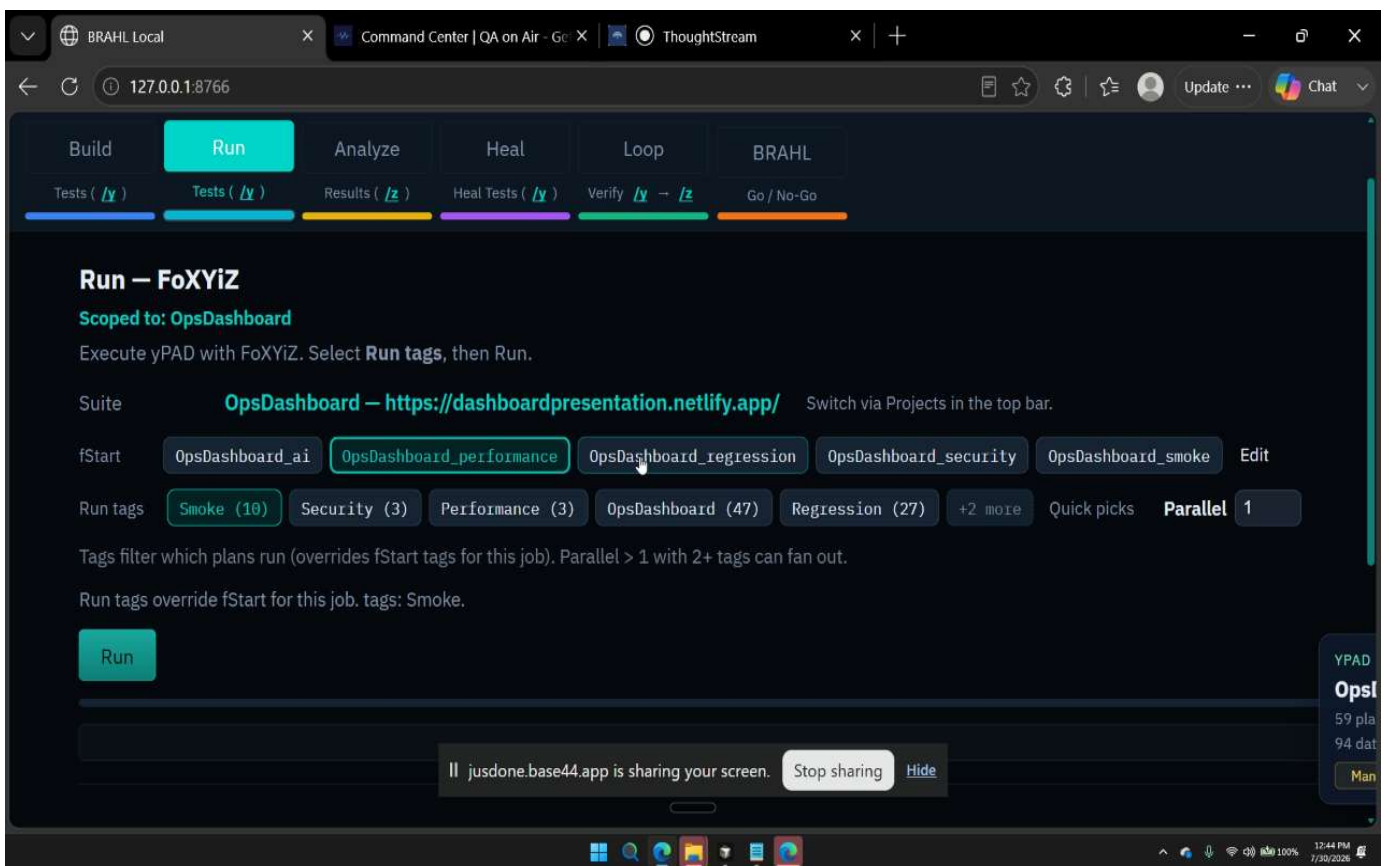

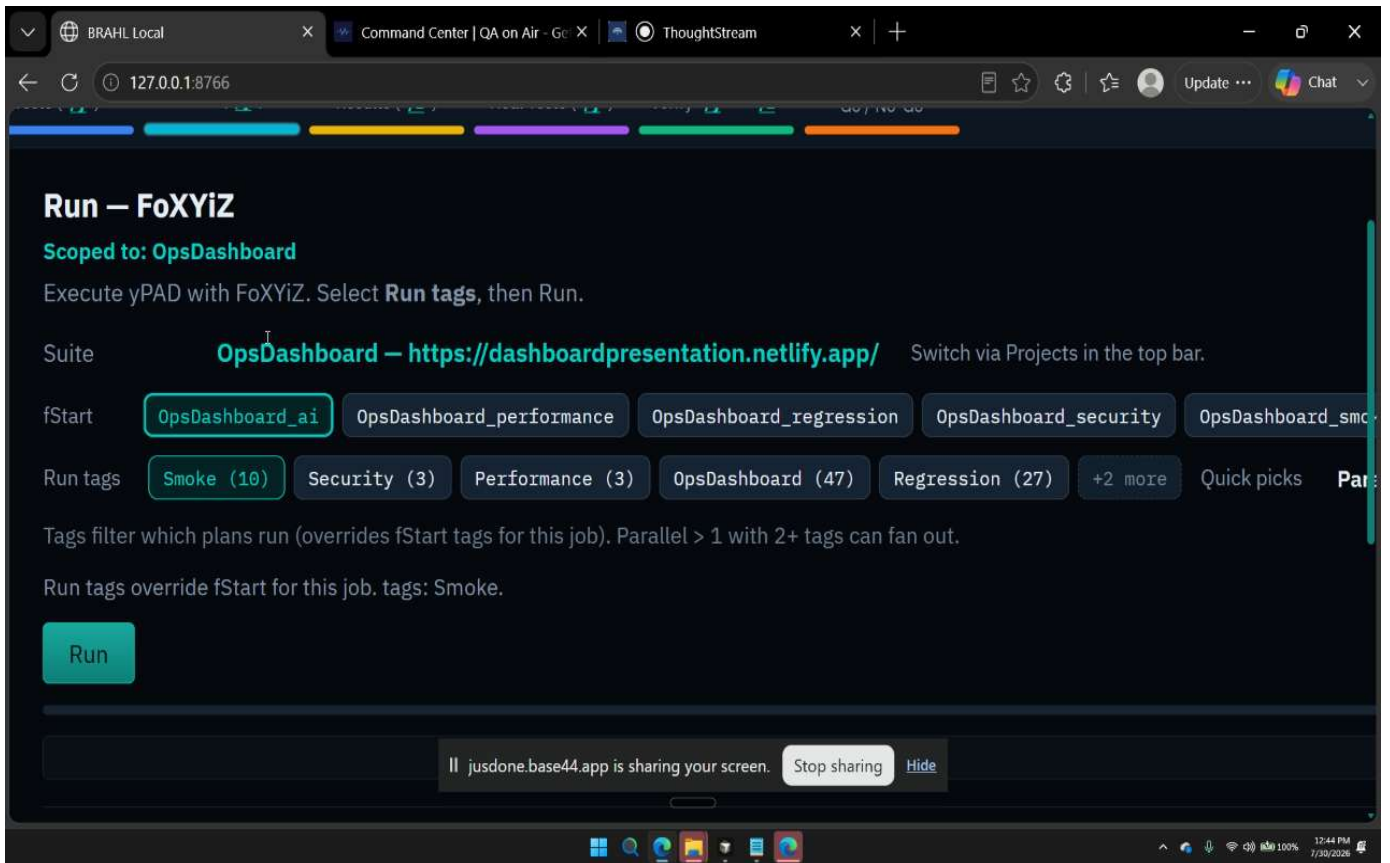

The user is frustrated by unnecessary dashboard clutter and the absence of expected test artifacts like screenshots and video recordings in the 'Analyze' section. They require a cleaner interface and a reliable way to access and review visual evidence after test execution.

KEY POINTS

- Simplify dashboard clutter by removing unnecessary pre-defined stacks, focusing only on runtags.
- Ensure automated screenshots and video recordings are correctly captured and surfaced in the 'Analyze' view.
- Resolve issues causing empty execution summaries in the reporting output.
- Improve the fStart configuration management to allow for cleaner editing and single-instance control.

TRANSCRIPTION

All right. Additionally, there are a few issues that we created and we missed a few features. One, fstart should only be one and we can edit it. Why do I have these stacks of open dashboard, ops dashboard, AI, performance regression, security, and smoke? I don't need them. Runtags is all I need. After run, I'm not seeing, we built so much on the visualization part, where we take screenshots, we do a video recording. Where are those coming in after?

Let's say I do on every step, and video I do on every step, and I save this, and I just do smoke one test and I run it. After it finishes, I need to see, where will I see it? Either it should be there in analyze, it must be there in analyze, the entire video recording, the entire images page with thumbnails. Where is it right now? Let it run. It's running the tests. I'm letting it do its job. I think run is done. Execution summary, again blank. These are repetitive errors that we're making. I don't know why. Maybe, let's make sure we clean up everything out here and we put it correctly.
